

SERVICE MANUAL

STEREO POWER AMPLIFIER

SANSUI B-77

SPECIFICATIONS

Power output

Min. RMS, both channels driven, from 20 to 20,000 Hz, with no more than 0.03 % total harmonic distortion
60 watts per channel into 8 ohms

Load impedance

8 ohms

Total harmonic distortion

less than 0.03 % at or below rated min. RMS power output

Frequency response (at 1 watt)

5 to 70,000 Hz
+0 dB, -2 dB

Input sensitivity and impedance (1 kHz, for rated power output)

1 V/47 kilohms

Hum and noise (short-circuit, A-network)

115 dB

Power requirements

Power voltage 110 ~ 120, 220 ~ 240 V
(50/60 Hz)

For U.S.A. & Canada 120 V (60 Hz)

Power consumption 255 watts Rated

350 watts Maximum

UL, CSA Model 230 watts 275 VA Rated

Dimensions

430 mm (16-15/16") W

148 mm (5-7/8") H

230 mm (9-1/16") D

Weight

6.4 kg (14.1 lbs) net

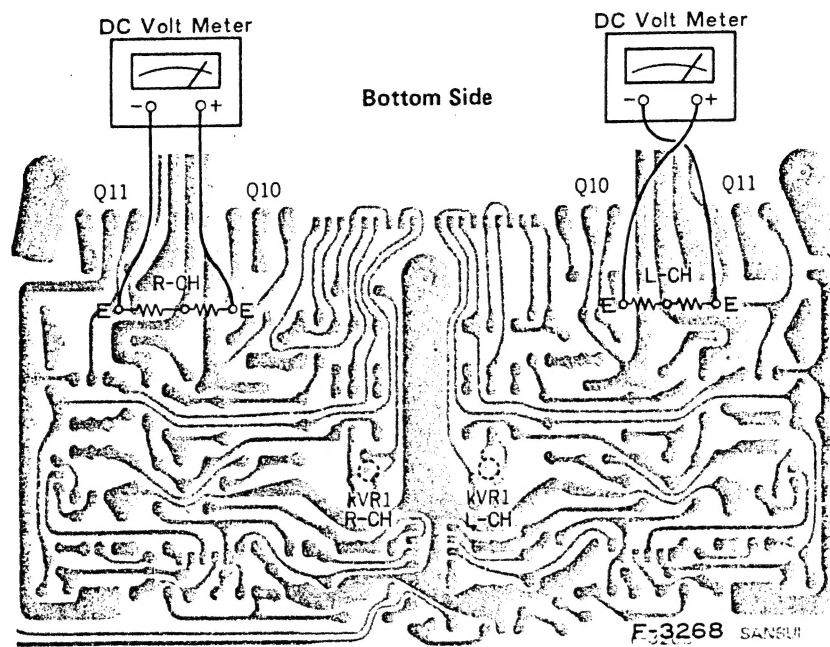

7.3 kg (16.1 lbs) packed

- In order to simplify the explanation illustrations may sometimes differ from the originals.

Sansui

SANSUI ELECTRIC CO., LTD.

7. ADJUSTMENTS

7-1. Bias Current Adjustment (Refer to figure above)

- Note:
1. Room Temperature 18°C ~ 38°C
 2. For adjustment, run the unit for more than 3 minutes after the power is switched on.
 3. Before turning ON power switch, turn kVR1 on F-3268 fully counterwise.

STEP	SUBJECT	MEASURE OUTPUT	ADJUST	ADJUST FOR	REMARKS
1.	L-CH	Connect DC volt meter between emitters of kQ ₁₀ , kQ ₁₁ on F-3268	kVR1 (L-CH) F-3268	DC 3 mV	This bias current adjustment converts current value into voltage by ohms law
2.	R-CH	Same as above	kVR1 (R-CH) F-3268	DC 3 mV

Numbers of the wave-forms shown in Fig. 3-2 correspond to those which show the positions in the Block Diagram.

Fig. 3-2

3-1. Basic Operation

Fig. 3-1 shows a basic circuit configuration of the spectrum analyzer. An audio output is first divided into eight frequency bands through the eight filters and, next, is dynamic-driven by the counter in order to light up the corresponding display tubes.

To explain the dynamic drive in more detail, if the audio output includes, for instance, a frequency of 4 kHz, the output pulse generated from the counter turns ON the transistor nQ_3 and, thereby, a voltage is applied to the plates of all the display tubes. In addition, the pulse which turns ON the transistor nQ_3 also turns ON the nIC_4 and, thereby, another voltage is also applied to the grids G_3 of the display tubes for displaying 4 kHz. Since two voltages are applied to both the plates and grids of the display tubes for displaying 4 kHz, it follows that the display tubes for 4 kHz turn ON in proportion to an audio output level of 4 kHz.

In other words, it may be possible to consider that the pulses generated from the counter can close both the switches connected in series to the plates and grids of the eight display tubes at the same time, at a cycle of 1 kHz, beginning from the display tubes for 16 kHz to those for 30 Hz one by one. And, if an audio signal is input to the filter of a frequency band, the display tubes which correspond to its frequency band keep turning ON only while both the switches connected in series to the plates and grids of the corresponding display tubes are closed. However, since both the switches are dynamic-driven at a frequency of 1 kHz, the display tubes look as if they continuously stay ON without any blinking.

3-2. Blanking Operation

In addition, five ICs as comparator of nIC_4 , nIC_5 , nIC_6 and nIC_8 connected with grid of display tube has function of open-collector which produces a switching ON and OFF by input level.

Accordingly, the wave-forms of the output pulses should look like the ones ⑥, ⑥, and ⑥ shown in Fig. 3-2. The hatched parts of these pulses are not included in the actual output pulses. If these hatched parts of the output pulses were applied to the plates of the display tubes, the display tubes would grow dim in cooperation with the timing pulses for the succeeding band which are applied to the grids of the display tubes.

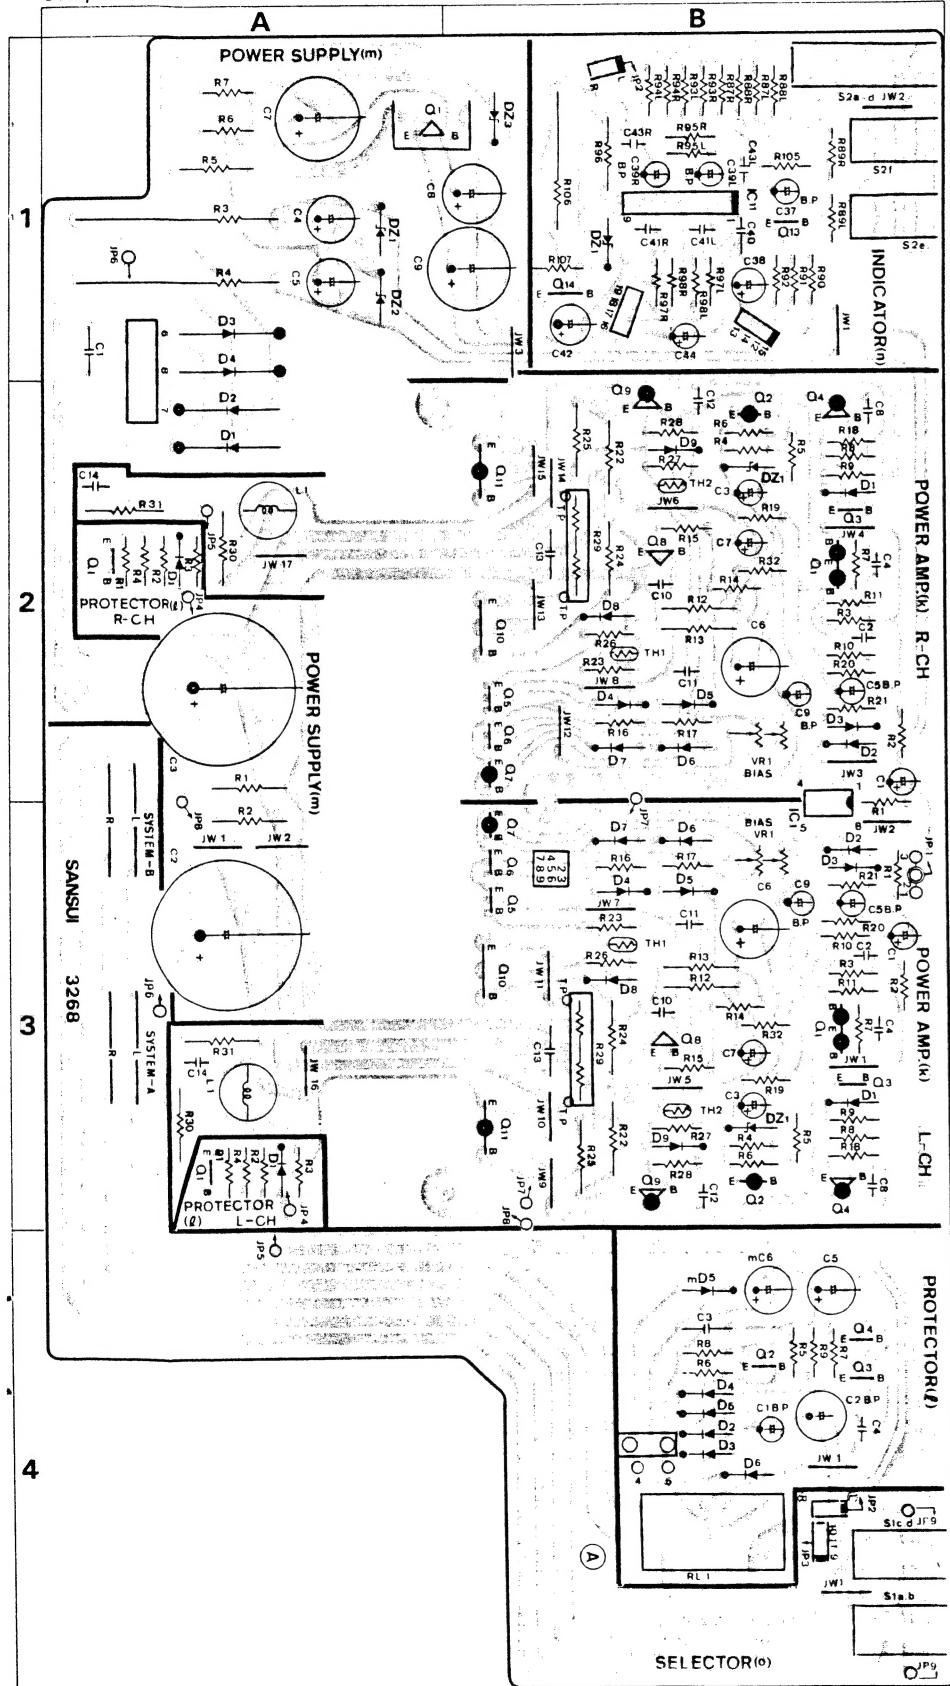

In order to prevent this, a one-shot multivibrator circuit nIC_{10} and a transistor nQ_{11} are provided so that voltage cannot be applied to the grids of the display tubes, as shown by ⑦, ⑦, and ⑦ in Fig. 3-2, when the voltages of the hatched parts of the output pulses are being applied to the plates of the display tubes. That is to say, the circuit is so designed that blanking is performed for the timing pulses which are applied to the grids of the display tubes, with the result that the display tubes can light up correctly and clearly.

Voltage applied to plate of the display tube maintains same level during a few seconds by influence of base carrier storage effect of nQ_1 to nQ_{10} even though these transistors are in cut-off state.

4. PARTS LOCATION & PARTS LIST

4-1. F-3268 Power Amp Circuit Board (Stock No. 07085501)

Component Side

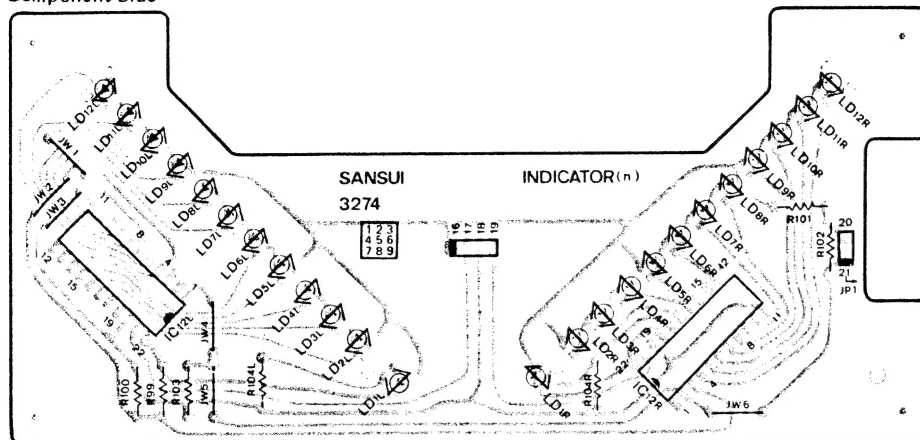

• Since some of capacitors and resistors are omitted from parts lists in this Service Manual, refer to the new Common Parts List for capacitors & resistors.
